

**U.S. NAVAL AIR STATION (NAS) SIGONELLA  
CONSUMER CONFIDENCE REPORT  
MINEO FAMILY HOUSING AREA  
2010**

**About this report.**

We are proud to present to you our annual drinking water quality report. This Consumer Confidence Report (CCR) provides valuable information on water quality and supports the Navy's commitment to provide high quality drinking water to our service members, their families, and DoD personnel. Presented in this report is information regarding the source of our water, its constituents, and the health risks associated with any contaminants detected in quantities exceeding a drinking water regulatory maximum contaminant level (MCL) or an action level (AL). The report covers the period of 1 January through 31 December 2010.

**What standards apply to drinking water overseas?**

DoD water systems in Europe must comply with country specific Environmental Final Governing Standards (FGS). The Environmental Final Governing Standards-Italy (IFGS) were developed after a comprehensive review and comparison of U.S. Environmental Protection Agency (USEPA) Safe Drinking Water Act (SDWA) and Italian drinking water standards. When Italy and USEPA standards are different, the most protective requirement was adopted into the IFGS. This assures U.S. personnel, family members, and Italian employees receive drinking water which meets requirements mutually agreed upon by the U.S. and Italy.

**Is my water safe?**

Tap water provided to the Mineo Family Housing Area in 2010 met IFGS, USEPA Primary Drinking Water Standards, and Italian drinking water standards. The chemical and biological analyses were below allowed MCLs established by the above drinking water standards.

# **Annual Declaration of Potability**

**The Naval Air Station, Sigonella, Italy, (Mineo) drinking water is declared POTABLE.** This declaration is based on the Annual Drinking Water Surveillance results conducted by US ARMY PUBLIC HEALTH COMMAND REGION – EUROPE for calendar year 2010, and current U.S. Naval Air Station, Sigonella, Italy, Public Works Department, Environmental Division water analysis and test results.

Michael Bowe-Rahming  
LTJG, MSC, USN  
Preventive Medicine/Environmental Health Officer  
Preventive Medicine Department  
U.S. Naval Hospital Sigonella, Italy

## **Where does my water come from?**

The Mineo Housing facility purchases treated water from Pizzarotti & C., S.p.A. The water provided to the Mineo Housing facility comes from one ground water well located outside the installation property. The drinking water is chlorinated before it is distributed to the housing area.

## **Source water assessment and its availability.**

A source water assessment was conducted by an environmental engineering company contracted by the Navy. The last survey was completed in January 2009. Possible sources of potential contamination of the wells include local agricultural activities. Additional information about the source water assessment is available from the Public Works Environmental Office at 624-2722.

## **Why are there contaminants in my drinking water?**

Drinking water, including bottled water, may reasonably be expected to contain at least small amounts of some contaminants. The presence of contaminants does not necessarily indicate that the water poses a health risk. More information about

contaminants and potential health effects can be obtained from the Safe Drinking Water website, [www.epa.gov/safewater/sdwa](http://www.epa.gov/safewater/sdwa). The source of your drinking water is groundwater produced at one well. As water travels through the ground, it dissolves naturally occurring minerals (including radioactive material), and can pick up substances resulting from the presence of animals or from human activity. Contaminants that may be present in source water can include the following:

- Microbial contaminants, such as viruses and bacteria, may come from septic systems, agricultural livestock operations, and wildlife.
- Inorganic compounds, such as salts and metals, can be naturally occurring or result from urban stormwater runoff, industrial, domestic wastewater discharges, or farming.
- Pesticides and herbicides may come from a variety of sources such as agriculture, urban stormwater runoff, and residential uses.
- Organic chemicals, including synthetic and volatile organic chemicals, are by-products of industrial processes and can also come from gas stations, urban stormwater runoff, and septic systems.
- Radioactive compounds can be naturally occurring.

### **How can I get involved?**

Customers should always observe water conservation practices. Water is a scarce resource in Sicily and everyone's cooperation in conserving water is greatly appreciated. If you have any questions, concerns, or ideas, please contact the Public Works Environmental Office Drinking Water Program Manager at 624-2722.

### **For what compounds is Mineo Housing drinking water tested?**

Drinking water at the Mineo Housing Area is tested at least monthly and analyzed according to standards established by the IFGS. The water is analyzed for inorganic chemicals, volatile organic chemicals, pesticides, disinfection by-products, radionuclides, microbiological contaminants, and residual chlorine (residual disinfectant). Information on the specific compounds tested and the testing frequency is available from the Public Works Environmental Office at 624-2722.

### **Do I need to take special precautions?**

Some people may be more vulnerable to contaminants in drinking water than the general population. Immuno-compromised persons such as those undergoing chemotherapy, persons who have undergone organ transplants, people with HIV/AIDS

or other immune system disorders, some elderly, and infants can be particularly at risk from infections. These people should seek advice about drinking water from their health care providers. USEPA/Centers for Disease Control and Prevention guidelines on appropriate means to lessen the risk of infection by Cryptosporidium and other microbial contaminants are available from the Safe Water Drinking website, [www.epa.gov/safewater/sdwa](http://www.epa.gov/safewater/sdwa).

**Water quality data table.**

The following tables list the level of the detected drinking water contaminants regulated by the IFGS which were monitored during 2010, and compounds detected in previous years that are on a greater than one-year monitoring cycle. The presence of contaminants in the drinking water does not necessarily indicate that the water poses a health risk.

Contaminants (units)	USEPA MCLG or MRDLG	IFGS MCL	Your Water	Range		Year	Violation	Typical Source
				Low	High			
<b>Disinfectants and Disinfection By-products</b>								
Chlorine (as Cl <sub>2</sub> ) (ppm)	4	4	0.72	0.04	0.72	2010	No	Water additive used to control microbes.
TTHMs (total trihalomethanes) (ppb)	zero	30	0.9	NA	0.9	2010	No	By-product of drinking water disinfection.
<b>Inorganic Contaminants</b>								
Sodium (ppm)	NA	200	18	NA	18	2010	No	Erosion of natural deposits, leaching.

Contaminants (units)	USEPA MCLG or MRDLG	IFGS MCL	Your Water	Range		Year	Violation	Typical Source
				Low	High			
<b>Inorganic Contaminants (continued)</b>								
Nitrate (as Nitrogen) (ppm)	10	10	2.7	NA	2.7	2010	No	Runoff from fertilizer use; leaching from septic tanks, sewage; erosion of natural deposits.
Total Nitrate and Nitrite (as Nitrogen) (ppm)	10	10	2.7	NA	2.7	2010	No	Runoff from fertilizer use; leaching from septic tanks, sewage; erosion of natural deposits.
Turbidity (NTU)	NA	Acceptable to consumer	0.70	0.12	0.70	2010	No	Soil runoff.
<b>Radioactive Contaminants</b>								
Alpha Emitters (pCi/L)	zero	15	0.82	-0.004	0.82	2008-2009	No	Erosion of natural deposits.
Beta/photon emitters (pCi/L)	zero	50	2.3	2.0	2.3	2008-2009	No	Decay of natural and man-made deposits.

The table below lists the average level of drinking water contaminants not required by the IFGS to be tested every year.

Contaminants (units)	MCL	Average	Year	Violation	Typical Source
Fluoride (ppm)	1.5	0.22	2008	No	Erosion of natural deposits, discharge from fertilizer and aluminum factories.

Unit Descriptions	
Term	Definitions
NA	Not applicable.
NTU	Nephelometric Turbidity Unit – A unit for measuring turbidity. Turbidity is a measure of

	the cloudiness of the water.
pCi/L	Picocuries per liter - A unit for measuring radioactivity.
ppb	Parts per billion, or micrograms per liter (µg/L).
ppm	Parts per million, or milligrams per liter (mg/L).

<b>Important Drinking Water Definitions</b>	
<b>Term</b>	<b>Definitions</b>
AL	Action Level - The concentration of a contaminant which, if exceeded, triggers treatment or other requirements which a water system must follow.
MCL	Maximum Contaminant Level – The highest level of a contaminant that is allowed in drinking water. USEPA sets MCLs as close to the MCLG as feasible using the best available treatment technology. MCLs are set by the USEPA or Italian water standards, and the most conservative (typically the lowest) value is adopted by the IFGS.
MCLG	Maximum Contaminant Level Goal – The level of a contaminant in drinking water below which there is no known or expected risk to health. MCLGs are set by USEPA, and include a margin of safety.

For more information, please contact the Public Works Environmental Office at 624-2722.
